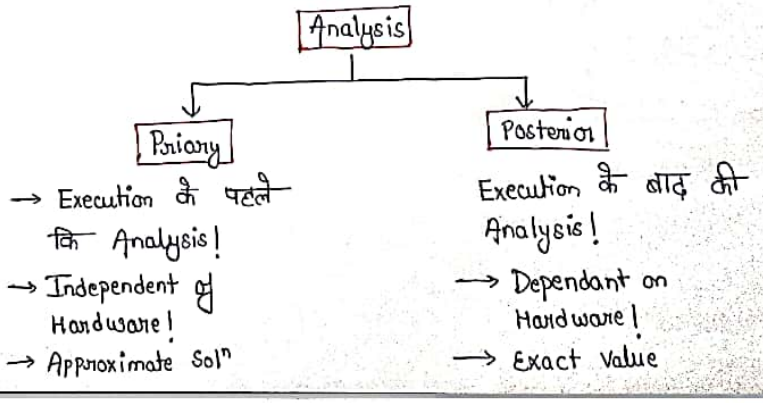
Q. क्या है ये Algorithm?

→ Finite set of steps to solve a problem is called algorithm.

→ अपने को Algorithm का Analysis करना है, कैसे करे

Analysis : Time complexity & Space Complexity!

→ Analysis करने से अपने को ये idea milta है कि konsa Algorithm kaha suitable है!



unacademy

Asymptotic Notation:

→ Used to describe running time of an algorithm showing the order of growth of function.

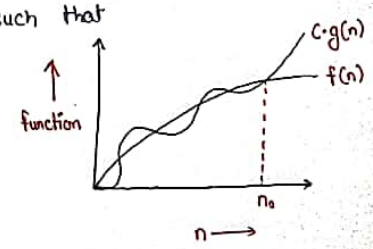
1. Big oh notation (O) : (upper bound)

f(n) is said to be the asymptotic upper bound of function g(n), If there a positive constant c & no such that

$$f(n) \leq c \cdot g(n)$$

where, $c > 0$

$n > n_0 \geq 0$

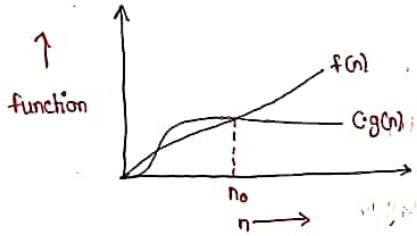


(2.) Big Omega (Ω) : (lower Bound)

$f(n)$ is said to be the asymptotic lower bound of function $g(n)$. If there exist a positive constant c & n_0 such that

$$f(n) \geq c \cdot g(n)$$

where, $c > 0$
$n > n_0 \geq 0$



(4.) Small oh notation : (o)

$$f(n) = o(g(n))$$

$$\text{iff} \lim_{n \to \infty} \frac{f(n)}{g(n)} = 0$$

(5.) Small omega notation : (ω)

$$f(n) = \omega(g(n))$$

$$\text{iff} \lim_{n \to \infty} \frac{f(n)}{g(n)} = \infty$$

	Reflexive	Symmetric	Transitive
(1.) Big (O): $f(n) \leq c \cdot g(n) \Rightarrow a \leq b$	✓	✗	✓
(2.) Big Omega (Ω): $f(n) \geq c \cdot g(n) \Rightarrow a \geq b$	✓	✗	✓
(3.) Theta (Θ): $c_1 g(n) \leq f(n) \leq c_2 g(n)$ $\Rightarrow f(n) = g(n)$ $\Rightarrow a = b$	✓	✓	✓
(4.) Small (o): $f(n) < c\,g(n)$ $\Rightarrow a < b$	✗	✗	✓
(5.) Small (ω): $f(n) > c \cdot g(n)$ $\Rightarrow a > b$	✗	✗	✓

unacademy

Comparison of various Time complexities :

$$O(c) < O(\log\log n) < O(\log n) < O(n^{1/2}) < O(n) < O(n\log n) < O(n^2) < O(n^3) < O(n^k) < O(2^n) < O(n^n) < O(2^{2^n})$$

unacademy

(1.) $f_1(n) = n^2 \log n$

$f_2(n) = n (\log_n n)^{10}$

$n = 2$

$f_1(2) = 2^2 \log_2 2 = 4$

$f_2(2) = 2 (\log_2 2)^{10} = 2$

$n = 10^3$

$f_1(10^3) = 10^6 \log_{10} 10^3 = 3 \times 10^6$

$f_2(10^3) = 10^3 (\log_{10} 10^3)^{10} = 10^3 \times 3^{10}$

3×10^6 $\quad 3^{10} \times 10^3$

10^6 $\quad 3^9 \times 10^3$

$10^3 <$ $\quad 3^9$

$n = 10^{10}$

$f_1(10^{10}) = 10^{20} \log 10^{10}$

$= 10 \times 10^{20}$

$f_2(10^{10}) = 10^{10} (\log 10^{10})^{10}$

$= 10^{10} \times 10^{10}$

$f_1(n) \geq c\, g(n)$

$f_1(n) \geq c\, f_2(n) \Rightarrow f_1(n) = O(f_2(n))$

unacademy

$f_1(n) = n^2 \log n$ $\qquad f_2(n) = n (\log n)^{10}$

$n^2 \log n$ $\qquad n (\log n)^9$

n $\qquad (\log n)^9$

$\log n$ $\qquad \log (\log n)^9$

$\log n$ $\qquad 9 \log \log (n)$

$\log n > \log \log n$

GATE Q. $f_1(n) = 2^n$; $f_2(n) = n^{3/2}$; $f_3(n) = n\log_2 n$; $f_4(n) = n^{\log_2 n}$

What is the increasing order of asymptotic complexity.

Let $n = 2^{10}$

$f_1(n) = 2^{2^{10}} = 2^{1024}$

$f_2(n) = (2^{10})^{3/2} = 2^{15}$

$f_3(n) = 2^{10}\log_2 2^{10} = 10 \cdot 2^{10}$

$f_4(n) = 2^{10\log_2 2^{10}} = 2^{100}$

$\boxed{f_1 > f_4 > f_2 > f_3}$

GATE Q. Let $f(n) = n^2 \log n$ & $g(n) = n(\log n)^{10}$ be two positive functions of n. Which of the following statement is correct?

(a) $f(n) = O(g(n))$ and $g(n) \neq O(f(n))$

(b) $g(n) = O(f(n))$ and $f(n) \neq O(g(n))$

(c) $f(n) \neq O(g(n))$ and $g(n) \neq O(f(n))$

(d) $f(n) = O(g(n))$ and $g(n) = O(f(n))$

$n = 10^{10}$

$f(n) = 10^{20} \times \log 10^{10} = 10^{21}$

$g(n) = 10^{10}(\log 10^{10})^{10} = 10^{20}$

$f(n) > g(n)$

$\boxed{g(n) = O(f(n))}$

$n = 10^3$

$f(n) = 10^6 \log 10^3 = 3 \times 10^6$

$g(n) = 10^3 (\log 10^3)^{10} = 10^3 \times 3^{10} = 3^{10} \times 10^3$

3×10^6 $\quad$ $3^{10} \times 10^3$

3×10^6 $\quad$ $3 \times 3^9 \times 10^3$

10^3 $\quad$ 3^9

GATE Q. Which of them are true?

① $(n+k)^m = O(n^m)$

② $2^{n+1} = O(2^n)$

③ $2^{2n+1} = O(2^n)$

k & m are constants.

① $(n+k)^m = O(n^m)$

$(n+k)^m \leq c \cdot n^m$

$k = 1, \; m = 1$

$n + 1 \leq cn$ ✓

② $2^{n+1} = O(2^n)$

$2^{n+1} \leq c\,2^n$

$2^n \cdot 2 \leq c \cdot 2^n$

$2^n \cdot 2 \leq c \cdot 2^n$ ✓

$2^{n+1} = O(2^n)$

③ $2^{2n+1} = O(2^n)$

$2^{2n+1} \leq c\,2^n$

$2^n \cdot 2 \leq c \cdot 2^n$

$c = 2$

$2^n \cdot 2 \leq 2 \cdot 2^n$

$2n \leq n$ ✗

unacademy

Recurrence Relation :

→ A recurrence is an equation or inequality that describes a function in terms of its value on smaller inputs.

→ Arre, Mtlb agr simple language में बोलू तो बहुत सारे Algorithms are recursive in nature.

→ जब हम उन Algorithm को Analyse करते है तो अपने को एक Recurrence Relation Milta है।

→ Recurrence Relation Agr nikal liye toh smjho Time complexity भी Nikal gyi! कैसे? तो Vo aage btaunga dekhte jaao.

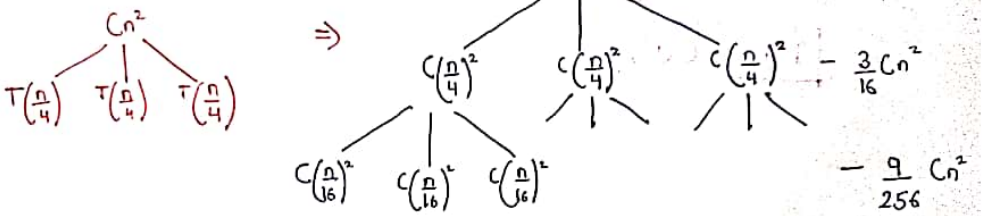
Solving Recurrence Relation

- Substitution Method
- Recurrence Tree Method
- Master's Theorem / Method

unacademy

Recurrence Tree Method :

① $T(n) = 3T\left(\frac{n}{4}\right) + n^2$ ← root



✱ Depth of the tree :

$\frac{n}{4^i} = 1 \Rightarrow n = 4^i$

$\log n = \log 4^i$

$\log n = i \log 4$

$\boxed{i = \log_4 n}$

✱ No. of leaves :

$3^i = 3^{\log_4 n}$

$\approx n^2$

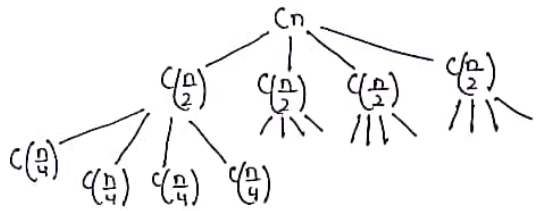
unacademy

∴ Total Cost

$$T(n) = Cn^2 + \frac{3}{16}Cn^2 + \left(\frac{3}{16}\right)^2 Cn^2 + \ldots\ldots + \theta(3^{\log_4 n})$$

$$\boxed{T(n) = \theta(n^2)}$$

(2.) $T(n) = 4T\left(\frac{n}{2}\right) + n$



Cn

$4\frac{Cn}{2} = 2Cn$

4Cn

⋮

✯ Depth of tree :

$\frac{n}{2^i} = 1$

$n = 2^i$

$\log n = \log 2^i$

$\log n = i \log 2$

$\boxed{i = \log_2 n}$

✯ No. of leaves :

$4^i = 4^{\log_2 n}$

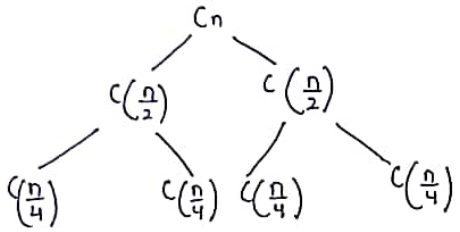
$= 2^{\log_2 n^2}$

$= n^2$

∴ Total cost = $Cn + 2Cn + 4Cn + \dots + \Theta(n^2)$

$\boxed{T(n) = \Theta(n^2)}$

(3.) $T(n) = 2T\left(\frac{n}{2}\right) + n$



— Cn

— Cn

— Cn

✯ Depth of the tree :

$\frac{n}{2^i} = 1 \Rightarrow \boxed{i = \log_2 n}$

✯ Level = Dept + 1

$= \log_2 n + 1$

✯ Total Cost = cost of each level x No. of level

$= Cn(\log_2 n + 1)$

$= Cn \log_2 n + Cn$

$\boxed{T(n) = Cn \log_2 n}$

Q.
```
fib(n)
  if(n=0)
    return 0
  if (n=1)
    return 1
  else
    return fib(n-1) + fib(n-2)
```

$$fib(n) = \begin{cases} 0, & \text{if } n=0 \\ 1, & \text{if } n=1 \\ fib(n-1) + fib(n-2), & n>1 \end{cases}$$

$T(n) = T(n-1) + T(n-2) + C$

Q. What is the time complexity?

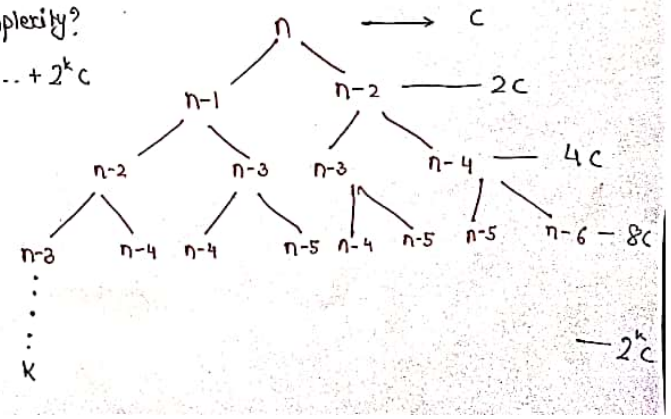
$C + 2C + 4C + 8C + \dots + 2^k C$

$C(1 + 2 + 4 + 8 + \dots 2^k)$

$C \cdot \frac{1(2^k - 1)}{2 - 1}$

$C \cdot (2^k - 1) \approx 2^k C$

$\boxed{O(2^n)}$



GATE-2007

Q. What is the time complexity of the following recursive function?

```
int DoSomething (int n)
{  if (n<=2)
     return 1;
   else
     return (DoSomething (floor (sqrt(n)) + n);
}
```

(a) $\Theta(n^2)$
(b) $\Theta(n \log_2 n)$
(c) $\Theta(\log_2 n)$
(d) $\Theta(\log_2 \log_2 n)$

$$T(n) = \begin{cases} T(\sqrt{n}) + C, & n > 2 \\ 1, & n <= 2 \end{cases}$$

$n \to n^{1/2} \to n^{1/4} \to \dots \to n^{1/2^k}$

$n^{\frac{1}{2^k}} = 2$

$\frac{1}{2^k} \log n = \log_2 2$

$\log_2 n = 2^k$

$\log \log_2 n = k \log 2$

$k = \log_2 \log_2 n$

$\Theta(k) = \Theta(\log_2 \log_2 n)$

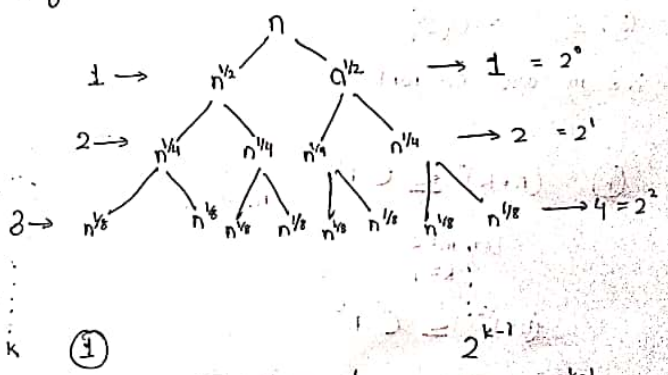
GATE

Q. Consider the following recurrence:

$$T(n) = 2T(\sqrt{n}) + 1, \quad T(1) = 1$$

Which one of the following is true?

(a) $T(n) = \Theta(\log \log n)$
(b) $T(n) = \Theta(\log n)$
(c) $T(n) = \Theta(\sqrt{n})$
(d) $T(n) = \Theta(n)$



$T(n) = 1 + 2^1 + 2^2 + \dots + 2^{k-1}$

$T(n) = 2^{k-1}$

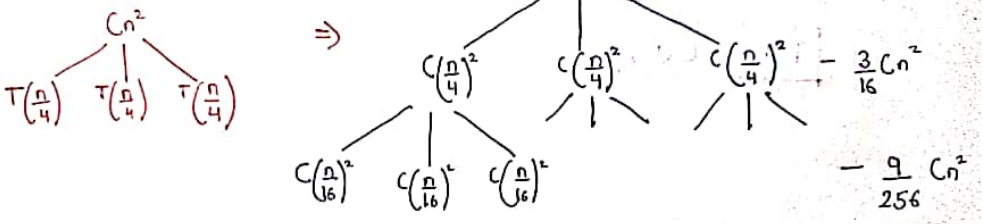
$= 2^{\log_2 \log_2 n - 1}$

$= \log_2 n - 1$

$T(n) = \Theta(\log_2 n)$

Recurrence Tree Method:

(1) $T(n) = 3T\left(\frac{n}{4}\right) + n^2$ ← root



$\Rightarrow$ $Cn^2 - Cn^2$

$C\left(\frac{n}{4}\right)^2 - \frac{3}{16}Cn^2$

$C\left(\frac{n}{16}\right)^2 - \frac{9}{256}Cn^2$

* Depth of the tree:

$\frac{n}{4^i} = 1 \Rightarrow n = 4^i$

$\log n = \log 4^i$

$\log n = i \log 4$

$i = \log_4 n$

* No. of leaves:

$3^i = 3^{\log_4 n}$

$\approx n^2$

unacademy

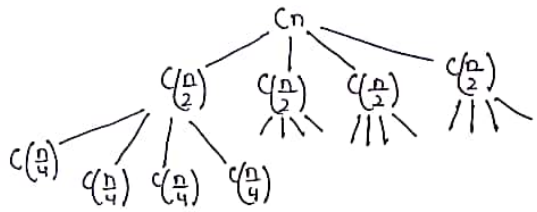
∴ Total Cost

$$T(n) = Cn^2 + \frac{3}{16}Cn^2 + \left(\frac{3}{16}\right)^2 Cn^2 + \ldots\ldots + \Theta(3^{\log_4 n})$$

$$\boxed{T(n) = \Theta(n^2)}$$

unacademy

(2.) $T(n) = 4T\left(\frac{n}{2}\right) + n$



Cn

$4\frac{Cn}{2} = 2Cn$

4Cn

⋮

✱ Depth of tree :

$\frac{n}{2^i} = 1$

$n = 2^i$

$\log n = \log 2^i$

$\log n = i \log 2$

$\boxed{i = \log_2 n}$

✱ No. of leaves :

$4^i = 4^{\log_2 n}$

$= 2^{\log_2 n^2}$

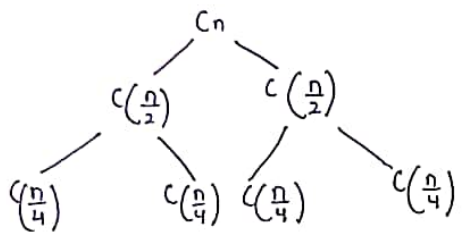
$= n^2$

∴ Total cost = $Cn + 2Cn + 4Cn + \ldots\ldots + \Theta(n^2)$

$\boxed{T(n) = \Theta(n^2)}$

unacademy

(3.) $T(n) = 2T\left(\frac{n}{2}\right) + n$



— Cn

unacademy

GATE

Q. Consider the following recurrence:

$T(n) = 2T(\sqrt{n}) + 1, \quad T(1) = 1$

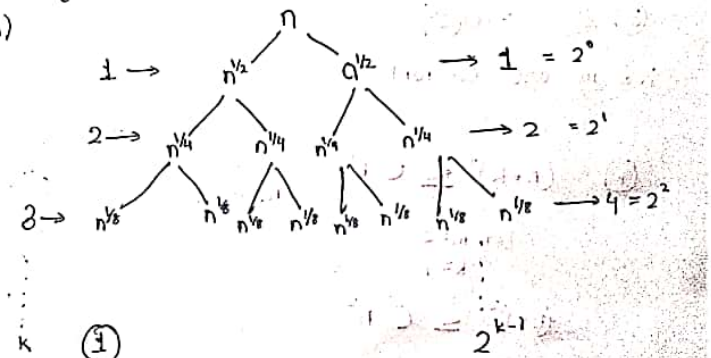
Which one of the following is true?

(a) $T(n) = \Theta(\log \log n)$

(b) $T(n) = \Theta(\log n)$

(c) $T(n) = \Theta(\sqrt{n})$

(d) $T(n) = \Theta(n)$



(1)

$T(n) = 1 + 2^1 + 2^2 + \dots + 2^{k-1}$

$T(n) = 2^{k-1}$

$= 2^{\log_2 \log_2 n - 1}$

$= \log_2 n - 1$

$T(n) = \Theta(\log_2 n)$

unacademy

Master's Theorem :

$$T(n) = a\,T\left(\frac{n}{b}\right) + F(n)$$

① Root level cost $>$ $f(n)$

$f(n) = O(n^{\log_b a - \varepsilon})$ for $\varepsilon > 0$

$T(n) = \Theta(n^{\log_b a})$

② Root level cost $=$ $f(n)$

$f(n) = \Theta(n^{\log_b a})$

$T(n) = \Theta(n^{\log_b a} \log n)$

③ Root level cost $<$ $f(n)$

$f(n) = \Omega(n^{\log_b a + \varepsilon})$

$T(n) = \Theta(F(n))$

unacademy

① $T(n) = T\left(\frac{n}{2}\right) + n$

$F(n) = n$, $f(n) = n^{\log_b a}$

$= n^{\log_2 1}$

$= n^0$

$T(n) = \Theta(n)$

② $T(n) = 4T\left(\frac{n}{4}\right) + n^2$

$F(n) = n^2$, $f(n) = n^{\log_b a}$

$= n^{\log_4 4}$

$= n$

$T(n) = \Theta(n^2)$

③ $T(n) = 27T\left(\frac{n}{3}\right) + n^3$

$F(n) = n^3$, $f(n) = n^{\log_3 27}$

$= n^{\log_3 3^3}$

$= n^3$

$T(n) = \Theta(n^3 \log n)$

④ $T(n) = 9T\left(\frac{n}{3}\right) + 4n^6$

$F(n) = 4n^6$, $f(n) = n^{\log_3 9}$

$= n^2$

$T(n) = \Theta(n^6)$

unacademy

Extended Master Theorem :

$$T(n) = aT\left(\frac{n}{b}\right) + \Theta(n^k \log^p n)$$

① If $a > b^k$ then $T(n) = \Theta(n^{\log_b a})$

② If $a = b^k$ then

(i) $p > -1 \longrightarrow T(n) = \Theta(n^{\log_b a} \log^{p+1} n)$

(ii) $p = -1 \longrightarrow T(n) = \Theta(n^{\log_b a} \log\log n)$

(iii) $p < -1 \longrightarrow T(n) = \Theta(n^{\log_b a})$

③ If $a < b^k$

(i) $p \geq 0 \longrightarrow T(n) = \Theta(n^k \log^p n)$

(ii) $p < 0 \longrightarrow T(n) = \Theta(n^k)$

unacademy

Q. $T(n) = 2T\left(\frac{n}{2}\right) + n\log^2 n$

$a = 2 \;,\; b = 2$
$k = 1 \;,\; p = 2$

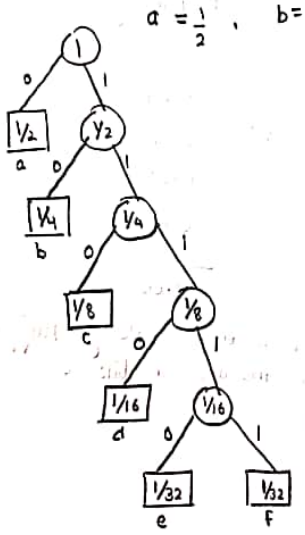
GATE-2007

Q. Suppose the letters a, b, c, d, e, f have probabilities $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}, \frac{1}{32}$ respectively. What is the average length of the Huffman code for the letters a, b, c, d, e, f ?

(a) 3
(b) 2.1875
(c) 2.25
(d) 1.9375

$a = \frac{1}{2}$, $b = \frac{1}{4}$, $c = \frac{1}{8}$, $d = \frac{1}{16}$, $e = \frac{1}{32}$, $f = \frac{1}{32}$



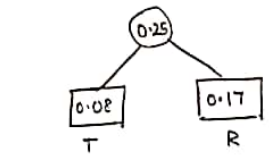
a = 0	$1 \times \frac{1}{2}$
b = 10	$2 \times \frac{1}{4}$
c = 110	$3 \times \frac{1}{8}$
d = 1110	$4 \times \frac{1}{16}$
e = 11110	$5 \times \frac{1}{32}$
f = 11111	$5 \times \frac{1}{32}$
	1.9375

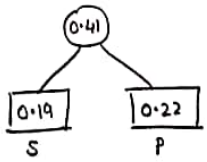
Q. A message is made up entirely of character set $X = \{P, Q, \ldots\}$. The table of probabilities for each is shown below:

Character	Probability
P	0.22
Q	0.34
R	0.17
S	0.19
T	0.08
Total	1.00

If a message of 100 characters over X is using Huffman coding, then the expected length of the encoded message in bits is

P = 0.22 Q = 0.34 R = 0.17 S = 0.19 T = 0.08





P - 01 — 2 × 0.22 = 0.44
Q - 11 — 2 × 0.34 = 0.68
R - 101 — 3 × 0.17 = 0.51
S - 00 — 2 × 0.19 = 0.38
T - 100 — 3 × 0.08 = 0.24

GATE-18
Q. Consider the weights and values of items listed below. Note that there is only one unit of each item.

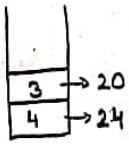
Item No	Weight (kg)	Value (in ₹)	V/W
1	10	60	6
2	7	28	4
3	4	20	5
4	2	24	12

The task is to pick a subset of these items such that their total weight is no more than 11 kgs and their total value is maximized. Moreover, no item may be split. The total value of items picked by an optimal algorithm is denoted by V_{opt}. A greedy algorithm sorts the items by their value-to-weight ratios in descending order and packs them greedily, starting from the first item in the ordered list. The total value of items picked by the greedy algorithm is denoted by V_{greedy}.

The value of $V_{opt} - V_{greedy}$ is _____.

unacademy

Item No.	Weight	Value	Value/Weight
4	2	24	12
1	10	60	6
3	4	20	5
2	7	28	4



~~4~~ 5

Knapsack capacity = 11

$V_{opt} = 60$ (Dekh के बता सकता कोई भी!)

$V_{greedy} = 20 + 24 = 44$

$V_{opt} - V_{greedy} = 60 - 44 = 16$

Q. Consider two strings:

A = "qpqrr"

B = "pqprqrp"

Let x be the length of the longest common subsequence between A & B. y be the no. of such LCS between A & B

Then, $x + 10y =$

pqrr
qpqr
qprr

$X = 4$

$Y = 3$

$X + 10Y = 4 + 10 \times 3 = \boxed{34}$

GATE-09

Q. A subsequence of a given sequence is just the given sequence with some elements (possibly none or all) left out. We are given two sequences $X[m]$ & $Y[n]$ of lengths m and n, respectively with indexes of X & Y starting from 0.

We wish to find the length of the longest common sub-sequence (LCS) of $X[m]$ and $Y[n]$ as $l(m,n)$ where an incomplete recursive definition for the function $l(i,j)$ to compute the length of the LCS of $X[m]$ and $Y[n]$ is given below:

$l(i,j) = 0$, if either $i=0$ or $j=0$

$= expr1$, if $i,j>0$ & $X[i-1] = Y[j-1]$

$= expr2$, if $i,j>0$ & $X[i-1] \neq Y[j-1]$

Which one of the following options are correct?

(a) $expr1 = l(i-1,j)+1$

(b) $expr1 = l(i,j-1)$

(c) $expr2 = max(l(i-1,j), l(i,j-1))$

(d) $expr2 = max(l(i-1,j-1), l(i,j))$

GATE-09

Q. A sub-sequence of a given sequence ..... starting from 0.

मात्र कुछ Pichle ques जो Likha है!

The value of $l(i,j)$ could be obtained by dynamic programming based on the correct recursive definition of $l(i,j)$ of the form given below, using an array $L[M,N]$ where, $M = m+1$ & $N = n+1$ such that $L[i,j] = l(i,j)$

Which of the following statements would be TRUE regarding the dynamic programming solution for the recursive definition of $l(i,j)$?

(a) All elements of L should be initialized to 0 for the values of $l(i,j)$ to be properly computed.

(b) The values of $l(i,j)$ may be computed in a row major order or column major order of $L[M,N]$.

(c) The values of $l(i,j)$ cannot be computed in either row major order or column major order of $L[M,N]$.

(d) $L[p,q]$ needs to be computed before $L[r,s]$ if either $p<r$ or $q<s$.

unacademy

GATE-10

Q. The weight of a sequence $a_0, a_1, \ldots a_{n-1}$ of real no. is defined as $a_0 + a_1/2 + \ldots + a_{n-1}/2^{n-1}$. A subsequence of a sequence is obtained by deleting some elements from the sequence, keeping the order of the remaining elements the same. Let X denote the maximum possible weight of a subsequences of $a_0, a_1, \ldots a_{n-1}$ and Y the maximum possible weight of a subsequence of $a_1, a_2 \ldots a_{n-1}$. Then X is equal to

(a) $\max(Y, a_0 + Y)$
(b) $\max(Y, a_0 + Y/2)$
(c) $\max(Y, a_0 + 2Y)$
(d) $a_0 + Y/2$.

$S = \langle a_0, S_1 \rangle$

$S_1 = \langle a_1, a_2 \ldots a_{n-1} \rangle$

Case1: जब a_0 होगा :

$X = \text{weight}(\langle a_0, S_1 \rangle) = a_0 + \frac{1 \cdot Y}{2}$

Case 2: जब a_0 नही होगा :

$X = \text{weight}(\langle S_1 \rangle) = Y$

$\therefore$ Ans - $\boxed{\max\left(Y, a_0 + \frac{Y}{2}\right)}$

GATE-11

Q. An algorithm to find the length of the longest monotonically increasing sequence is in an array $A[0 : n-1]$ is given below:

Let L_i denote the length of the longest monotonically increasing sequence starting at index i in the array.

Initialize $L_{n-1} = 1$

For all i such that $0 \le i \le n-2$

$$L_i = \begin{cases} 1 + L_{i+1}, & \text{if } A[i] < A[i+1] \\ 1, & \text{otherwise} \end{cases}$$

$n = 5$
$L_4 = 1$

$0 \le i \le 3$

$L_0 = 1 + L_1$
$L_1 = 1 + L_2$
$L_3 = 1 + L_4$

Finally, the length of the longest monotonically increasing sequence is $\max(L_0, L_1, \ldots L_{n-1})$.

Which of the following statements is TRUE?

(a) The algo uses dynamic programming paradigm.
(b) The algo has a linear complexity and uses branch & bound paradigm.
(c) The algo has a non-linear polynomial complexity and uses B & B paradigm.
(d) The algo uses divide & conquer paradigm.

GATE-18

Q. Assume that multiplying a matrix G_1 of dimension $p \times q$ with another matrix G_2 of dimension $q \times r$ requires pqr scalar multiplications. Computing the product of n matrices $G_1, G_2, G_3 \ldots G_n$ can be done by parenthesizing in different ways. Define $G_i G_{i+1}$ as an explicitly computed pair for a given parenthesization if they are directly multiplied. For example, in the matrix multiplication chain $G_1 G_2 G_3 G_4 G_5 G_6$ using parenthesization $(G_1(G_2 G_3))(G_4(G_5 G_6))$, $G_2 G_3$ & $G_5 G_6$ are only explicitly computed pairs.

Consider a matrix multiplication chain F_1, F_2, F_3, F_4, F_5 where matrices F_1, F_2, F_3, F_4 & F_5 are of dimensions 2×25, 25×3, 3×16, 16×1, and 1×1000 respectively.

In the parenthesization of $F_1 F_2 F_3 F_4 F_5$ that minimizes the total no. of scalar multiplications, the explicitly computed pairs is/are

(a) $F_1 F_2$ & $F_3 F_4$ only

(b) $F_2 F_3$ only

(c) $F_3 F_4$ only

(d) $F_2 F_1$ & $F_4 F_5$ only

GATE-14

Q. Suppose you want to move from 0 to 100 on the number line. You either move right by a unit distance or you take shortcut (i,j), if you are at position i on the number line, you may directly move to j. Suppose T(k) denotes the smallest no. of steps needed to move from k to 100. Suppose, further that there is at most 1 shortcut involving any number and in particular, from 9 there is a shortcut to 15. Let y and z be such that

$$T(9) = 1 + \min(T(y), T(z))$$

Then, the value of the product yz is ——

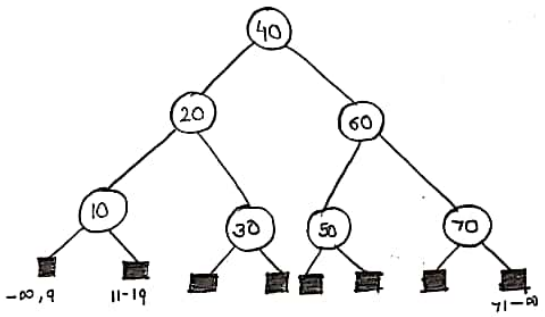
T(9) ⟶ Distance from 9 to 100

T(9) = 1 + min (Distance from y to 100, Distance from z to 100)

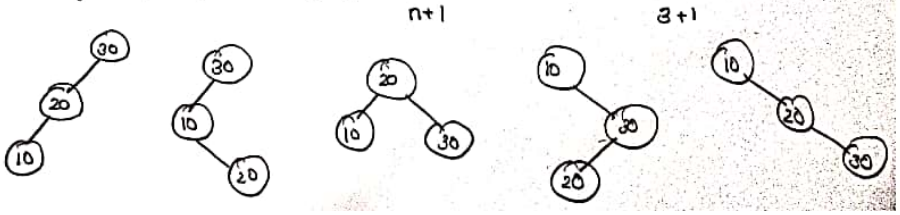
⟶ There are only 2 such values where we can reach from 9
- ↳ one is simple step to right on no. line (10)
- ↳ Another is shortcut (15)

∴ y = 10, z = 15 ⇒ yz = 10 × 15 = 150

OPTIMAL BINARY SEARCH TREE



Keys: 10, 20, 30 $\quad T(n) = \frac{^{2n}C_n}{n+1} \quad \Rightarrow T(3) = \frac{^{2\times3}C_3}{3+1} = 5$



→ For every key we have successful as well as unsuccessful probabilities which will be given.

→ We have to find a BST such that cost of searching any particular key should be minimum.

→ कैसे कर सकते : तो ek idea ye ho skta jitne bhi BST ho un sb का cost nikale aur jo minimum ho vo answer, pr ek din lgega agr key 5 ya 6 de diya jaaey!

→ Dynamic programming se yeh kaam krege jldi bina BST banaye!

$$c[i,j] = \min_{i<k\le j} \{ c[i,k-1] + c[k,j] + w[i,j] \}$$

$$w[i,j] = w[i,j-1] + p_j + q_j$$

Q. keys = {10, 20, 30, 40}

p_i = {3, 3, 1, 1} → successful search probabilities

q_i = {2, 3, 1, 1, 1} → unsuccessful search probabilities

Collision Resolution Techniques
- Separate Chaining / Open Hashing
- Open addressing / Closed Hashing
  - Linear Probing
  - Quadratic Probing
  - Double Hashing

Q किसको बोले एक अच्छा Hash Function :

→ Efficiency of hashing depends on the hash function.
→ Very common hash function :
$F(X) = X \%$ Hash tables size
→ Simple & Easy to compute
→ Should uniformly distribute keys.
→ Minimum number of collisions.

* Types of hash functions :

① Direct Hashing
→ No Algorithmic manipulation.
→ Min. no. of collision.
→ Limited to certain no. of keys.
→ Not suitable for large

② Modulo-Division
→ Also known as division remainder
→ works with any list size.
→ If the size list is prime no., km collision honge!

③ Mid-Square
→ middle of square
→ Square the key and middle of the required no. of address will be the add.
eg: k = 35 n = 2
$k^2 = 1225$ h(k) = 22

unacademy

④ Folding Hashing:

→ Fold shift hashing

* key value is divided into parts and then added to get required address.

eg: 123 456 789 , n=3

123
456
789
h(k)=368

discard → 1368

→ Fold Boundary hashing

* Left & right nos. are folded on a fixed boundary b/w them.

eg: 123 456 789

321
987
456
h(k)=764

discard ← 1764

⑤ Substraction:

→ Substract a fix no. from key.

$h(k) = k - C$

→ No collision

→ Suitable for small size list.

$h(k) = k - C$

Linked Lists

unacademy

→ Linear Data Structure in which elements are connected in linear order.

- → Singly linked list (SLL)
- → Doubly linked list (DLL)
- → Circular linked list
  - → Circular singly linked list (CSL)
  - → Circular doubly linked list (CDL)

→ Linked list/one way linked list is a linear collection of data items.

→ Elements are not stored in contiguous location.

unacademy

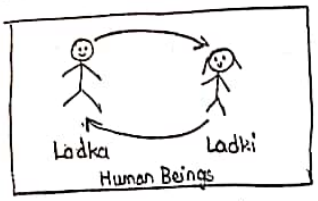
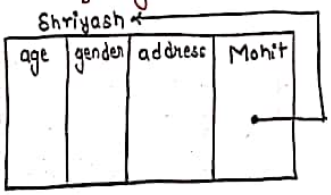
→ Self referential structure:



```
Struct Person
{   int age;
    char Naam, pata[20];
    Struct Person * Mohit;
} Shriyash;
```



Operations on Linked lists:

- → Traverse a node
- → Insert a new node
- → Delete existing node
- → Search for a node
- → Sort Nodes in ascending or descending order

unacademy

(1) Singly Linked List:

→ A singly linked list is one in which all the nodes are linked together in some sequential manner.

→ First node is accessed by external pointer (head).

→ Last node contains NULL value.

✡ Insertion at beginning:

unacademy

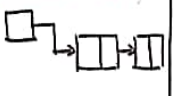
Insert_Begin (head, data, link, avail, item)

[head: pointer pointing to first node
data: data part of the node
link: address part of the node
avail: avail list for getting new node
item: item to be inserted

Step1: [To check overflow]
if (avail=-1) then
write "overflow"
return

Step2: [To break the node from avail list]
newnode = avail
avail = link[newnode]



Step3: [To add new node into data list]
link[newnode] = head
head = newnode

Step4: [To add item]
data[newnode] = item

Step5: Exit

unacademy

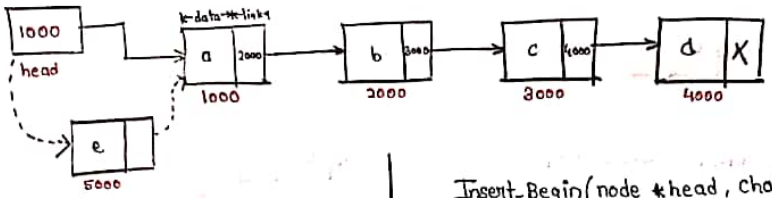
C- program implementation:



```
Struct node
{   char data;
    struct node *link;
}n1, *n2, *n3 ;

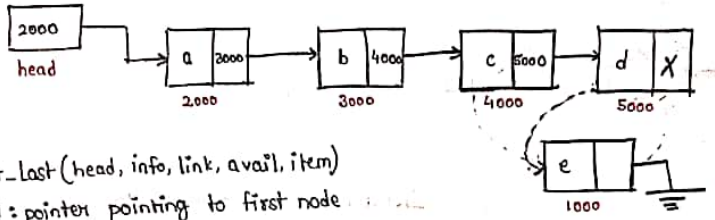
typedef structnode node ;

node*  nodebanao (char info)
{       node *p;
        p = (node*) malloc (size_of(node));
        p→ data = 'a';
        p → link = NULL;
}       return p;
```

```
Insert_Begin(node *head, char info)
{  node  * newnode;
   newnode = (node*) malloc (sizeof (node));
   newnode → data = info;
   newnode → link = head ;
   head = newnode;
   return head ;
}
```

unacademy

☆ Insertion at last:



Insert_Last (head, info, link, avail, item)

[head: pointer pointing to first node
data: data part of the node
Link: address part of the node
avail: avail list for getting new node
item: item to be inserted

Step1: [To check overflow]
if(avail=-1) then
write "overflow"
return

Step2: [To break the node from avail list]
newnode = avail
avail = link[newnode]

Step3: [To reach to the end of data list]
if (~~start~~ head == -1)
~~start~~ head = newnode
link[newnode] = -1

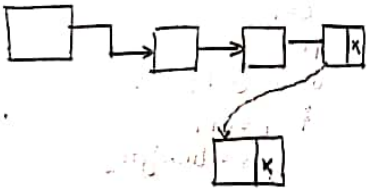
else
ptr = start
repeat step while (link[ptr] ≠ -1)
ptr = link[ptr]

Step4: link[ptr] = newnode
link[newnode] = -1

Step5: info[newnode] = item

Step6: Exit

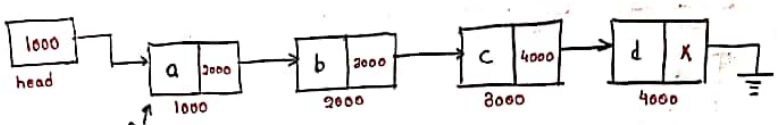
* C- programming implementation :



```
Insert_End (node *head, char info)
{
    node *p;
    p = (node *) malloc (sizeof(node));
    p -> data = info;
    p -> link = NULL;
    node *Q = head;
    while (Q -> link != NULL)
    {
        Q = Q -> link;
    }
    Q -> link = p;
    return head;
}
```

* Insertion at the middle of the list :

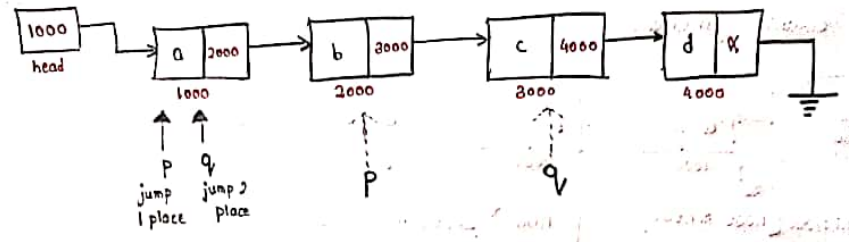
1. Using count function:

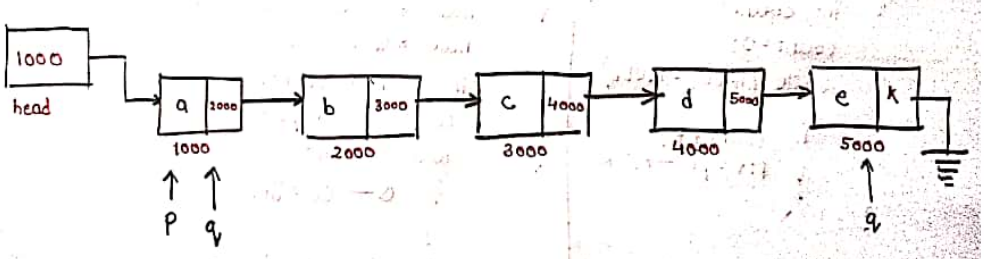


```
Countnode(node *head)
{
    int count;
    count = 0;
    While (head != NULL)
    {
        count++;
        ptr = ptr -> link;
    }
}
```

```
node* Insertmiddle (node *head, char, info)
{
    node *p = Createnode (info);
    node *Q = head;
    int count = countnode (head);
    count = count/2;
    while (--count)
    {
        Q = Q -> link;
    }
    p -> link = Q -> link;
    Q -> link = p;
    return head;
}
```

2. Using pointer :





```
node * middle_chalo(node *head)
{   node *p, *q;
    p = q = head;
    while ((q->link != NULL) && (q->link->link != NULL))
    {       q = q->link->link;
            p = p->link;
    }
    return p;
}
Insertmiddle(node *head, char info)
{   node *p = createnode(info);
    node *Q = middle_chalo(head);
    p->link = Q->link;
    Q->link = P;
    return head;
}
```

c=1
ptr = start
while (c≠ pos-1)
{ c=c+1
ptr = link[ptr]
}

Step4: link[newnode] = link[ptr]
link[ptr] = newnode

Step5: info[newnode] = item

Step6: Exit

C - programming implementation :

```
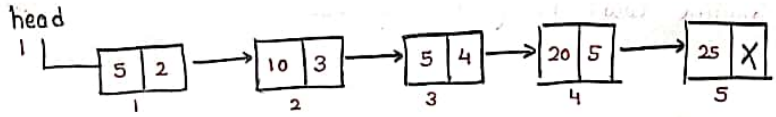
Insert-at-any-pos(node *head, char info)
{   node *p = Createnode(info);
    Node *q = head;
    for (i=1; i< pos-1 && q!= NULL; i++)
    {   q->link = p;
        return head;
    }
}
```

unacademy

Q. Consider the following Linked list:



(i) p = head → link → link → link

p = 4

(ii) head → link → link = p → link

4 → 5

(iii) p → link → link = p

Null = 4

unacademy

Q Fill in the blanks:

The following routine count no. of node in SLL.

```
int count()
{
  struct node *p = head;
  int c=0;
  while ( p )
  {
     ++c;
     p = p→link;
  }
```

(A) p

(B) !p

(C) p→link

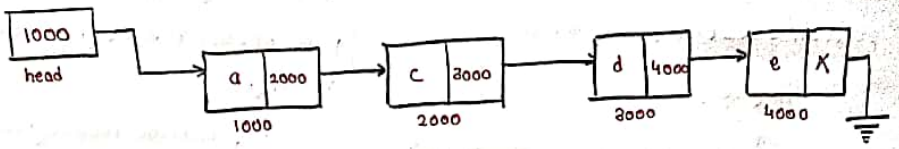
(D) !p→link

Q Fill in the blanks:

```
int Do(struct node *p)
{
  if( p )
    return 1+ Do(p→link);
  else
    return 0;
}
void main()
{
  printf("%d", Do(head));
}
```

unacademy

Printing Elements of linked list:



```
print_kr_de_bhai(node *head)
{
   while (head→link != NULL)
   {
     printf("%c", head→data);
     head = head→link;
   }
   printf("%c", head→data);
}
```

|| while (head != NULL)

O/P: a c d e

→ Using recursion :

```
print_kr_de_bhai(node *head)
{
    if (head)
    {
        printf("%c", head -> data);
        print_kr_de_bhai(head -> link);
    }
}
```

* Reverse भी print कर सकते है।

```
print_kr_de_reverse(node *head)
{
    if(head)
    {
        print_kr_de_reverse(head -> link);
        printf("%c", head -> data);
    }
}
```

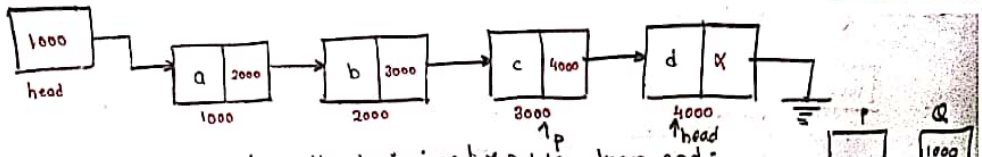
Searching in singly linked list:

```
Struct node {
  int data;
  struct node *next;
};
typedef struct node node;

int search(node *head, int info)
{  if (head == NULL) return 0;
   while (head != NULL)
   {  if (head -> data == info) return 1;
      head = head -> next;
      return 0;
   }
}
```

```
node * search (node *head, int info)
{  if (head == NULL) return NULL;
   while (head != NULL)
   {  if (head -> data == info)
      {  return head;
         head = head -> next;
      }
      return NULL;
   }
```

unacademy



☆ Delete a node from the beginning:

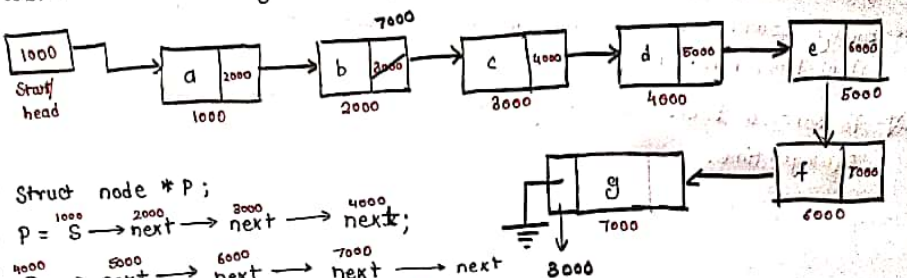
```
node * Delete_begin (node * head)
{
    node *p;
    p = head;
    head = head -> link;
    free(p);
    return head;
}
```

☆ Delete from end:

```
node * Delete_End (node *head)
{   node *p; node *Q = head;
    while (head -> link != NULL)
    {  p = head;
       head = head -> link;
    }
    free (head);
    p -> next = NULL;
    return Q;
```

unacademy

*** Q. Consider the linked list given below:



(1) Struct node *P;

(2) P = S -> next -> next -> next;
(1000, 2000, 3000, 4000)

(3) P -> next -> next -> next -> next
(4000, 5000, 6000, 7000)
= S -> next -> next;
(1000, 2000, 3000)

(4) S -> next -> next = P -> next -> next -> next;
(1000, 2000, 4000, 5000, 6000, 7000)

(5) Print(P -> next -> next -> next -> next -> next -> next -> next -> data)
(4000, 5000, 6000, 7000, 3000, 4000, 5000, 6000)

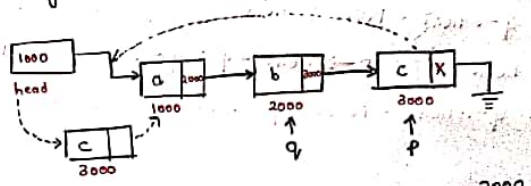
(f)

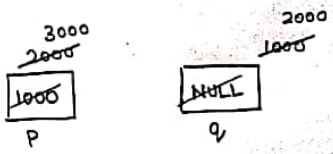
- Linear search works on linked lists. O(n)
- Binary search can be implemented on linked list but will take O(n) time, hence not used.
- To sort a linked list, merge sort can be used which will take O(nlogn) time.

GATE-10

Q. The following C function takes a singly linked list as input and modifies the list by moving the last element to the front of the list and returns the modified list. Some part of the code is left blank. Fill that blank:

```
typedef struct node {
int value;
struct node *next;
} node;
node *move_to_front(node *head)
{
    node *p, *q;
    if((head == NULL) || (head -> next == NULL))
        return head;
    q = NULL;
    p = head;
    while (p -> next != NULL)
    {
        q = p;
        p = p -> next;
    }
    return head;
```





```
p -> next = head;
q -> next = NULL;
head = p;
```

order chlega!

(a) q = NULL; p -> next = head; head = p;

(b) q -> next = NULL; head = p; p -> next = head;

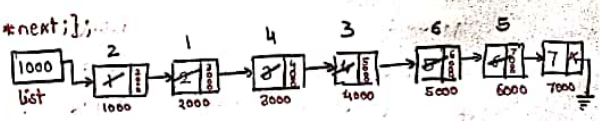
(c) head = p; p -> next = q; q -> next = NULL;

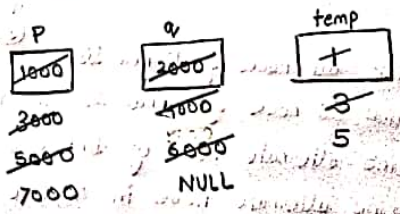
(d) q -> next = NULL; p -> next = head; head = p;

GATE-05

Q. The following C-function takes a singly linked list of integers as a parameter & rearrange the elements of the list. The list is represented as pointer to a structure. The function is called with the list after containing the integers 1,2,3,4,5,6,7 in the given order. What will be the contents of the list after the function completes execution?

```
struct node { int value; struct node *next;};
void rearrange (struct node *list)
{ struct node *p, *q;
  int temp;
  if (!list || !list -> next) return;
  p = list;
  q = list -> next;
  while (q) {
  temp = p -> value;
  p -> value = q -> value;
  q -> value = temp;
  p = q -> next;
  q = p ? p -> next : 0;
}}
```



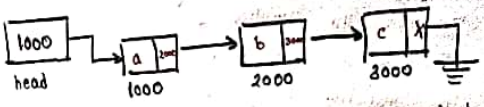


A) 1,2,3,4,5,6,7
B) 2,1,4,3,6,5,7
C) 1,3,2,5,4,7,6
D) 2,3,4,5,6,7,1

GATE

Q. What does the following function do for a given linked list with first node as head?

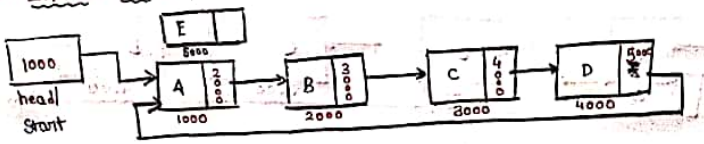
```
void fun1 (struct node *head)
{ if (head == NULL)
    return;
  fun1 (head -> next);
  printf ("%d", head -> data);
}
```



fun1(1000) | fun1(2000) | fun1(3000) | fun1(NU
if() X | if() X | if() X | if()✓
fun1(2000) | fun1(3000) | fun1(NULL)
a ③ | b ② | c ①

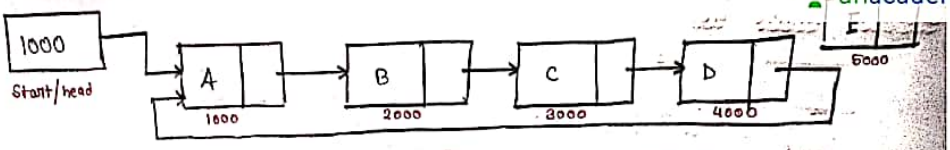
A. Prints all nodes of linked list
B. Prints all nodes of linked list in reverse order.
C. Prints alternate nodes of linked list.
D. Prints alternate nodes in reverse order.

Circular linked list :



Insert_Begin (info, link, start, avail, item)

1. [To check overflow]
   if (avail == -1) then
   write "overflow" return
2. [To break the node from avail list]
   newnode = avail
   avail = link[newnode]
3. if start == -1 then
   start = newnode
   link[newnode] = start
   else
   ptr = start
   repeat step while (link[ptr] ≠ start)
   ptr = link[ptr]
4. link[newnode] = start
   start = newnode
   link[ptr] = start
5. Exit



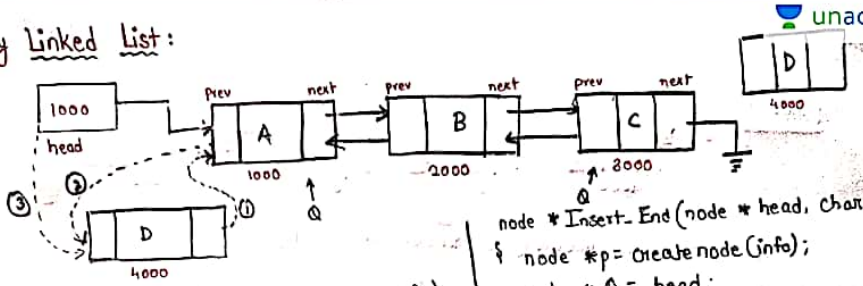
Insert_Last (info, link, start, avail, item)

1. [To check overflow]
   if (avail == -1) then
   write "Overflow"
   return
2. [To break the node from avail list]
   newnode = avail
   avail = link[newnode]
3. if start == -1
   start = newnode
   link[newnode] = start
   else
   ptr = start
   repeat step while link[ptr] ≠ start
   ptr = link[ptr]
4. link[ptr] = newnode
   link[newnode] = start
5. Exit

```
node *Insert_Begin (node *head, char info)
{
    node *p = Createnode (info);
    if (head == null)
    { head = newnode;
      newnode → next = head;
    }
    else {
        ptr = head;
        while (ptr → next != head)
        ptr = ptr → next;
    }
    newnode → next = head
    head = newnode
    ptr → next = head
}
```

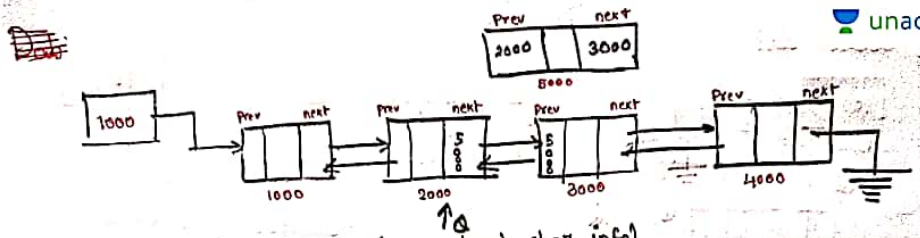
```
node *Last (node *head, char info)
{
    node *p = Createnode (info);
    node *Q = head;
    if (head == null)
    {
        head = newnode;
        newnode → next = head;
    }
    else {
        ptr = head;
        while (ptr → link != head)
            ptr = ptr → next;
    }
    ptr
    newnode → next = newnode;
    newnode → next = head;
}
```

Doubly Linked List:



```
node * Insert_Begin (node *head, char info)
{   node *newnode;
    newnode = (node*) malloc (sizeof (node));
    newnode → data = info;
    newnode → prev = null;
    newnode → next = null;
    newnode → next = head;
    head → prev = newnode
    head = newnode;
    return head;
}
```

```
node * Insert_End (node * head, char info)
{ node *p = Create node (info);
  node * Q = head;
if (head == null) { head = p; return head; }
else {
    while (Q → next != NULL)
    { Q = Q → next;
    }
    Q → next = p;
    p → prev = Q;
    return head;
  }
}
```



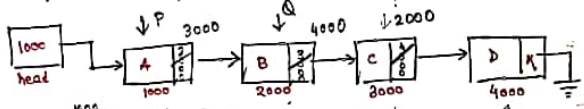
```
node * Insert_middle (node *head, char info)
{   node *p = Createnode(info);
    node *Q = reachmiddle(head);
    p -> prev = Q;
    p -> next = Q -> next;
    Q -> next -> prev = p;
    Q -> next = p
    return head;
}
```

GATE-05
Q. Which of the following statements is true?

I. As the no. of entries in a hash table increases, the no. of collission increases.
II. Recursive programs are efficient.
III. The worst case complexity of Quicksort is $O(n^2)$
IV. Binary search using a linked list is efficient

A. I and II B. II & III C. I & IV D. I & III

GATE
Q. Let p be the pointer as shown



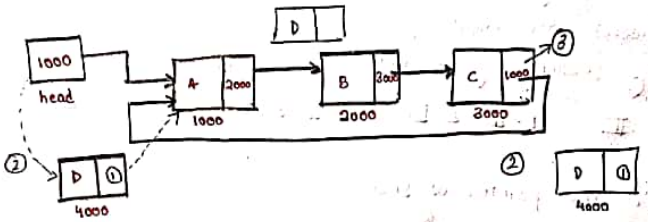
q = p -> next : 2000
p -> next = q -> next
q -> next = (q -> next) -> next
(p -> next) -> next = q

Swaps the two nodes next to p in the linked list

इस Code क्या कर रहा है?

GATE
Q. In a circular linked list organisation, insertion of a record involves modification of :

A. One pointer B. Two pointers C. Multiple pointers D. No pointers.



→ At beginning = 3
→ At last = 2
→ At middle = 2

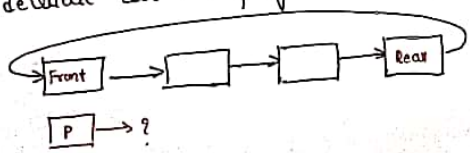
GATE UGC-NET
Q. Linked lists are not suitable data structure for which one of the following problems?

A. Insertion sort B. Binary Search C. Radix sort D. Polynomial manipulation

GATE-04
Q. Suppose each set is represented as a linked list with elements in order. What Which of the operations among union, intersection, membership, cardinality will be the slowest?

A. union only
B. intersection, membership
C. membership, cardinality $O(n_1 + n_2)$
D. union, intersection $O(n_1 \times n_2)$

GATE-04
Q. A circularly linked list is used to represent a Queue. A single variable p is used to access the Queue. To which node should p point such that both the operations enQueue & deQueue can be performed in constant time?



A. rear node
B. front node
C. not possible with a single ptr.
D. node next to front

* EnQueue : Insert newNode after Rear and make Rear point to inserted node :

```
newNode → next = rear → next;
rear → next = newNode;
rear = newNode;
```

* DeQueue : Delete the front node & make the second node the front node.

```
front = rear → next;
rear → next = front → next;
free(front);
```

Which one of the following is the time complexity of the most implementation of 'enqueue' and 'dequeue' respectively for this data structure.

(A) $\Theta(1)$, $\Theta(1)$
(B) $\Theta(1)$, $\Theta(n)$
(C) $\Theta(n)$, $\Theta(1)$
(D) $\Theta(n)$, $\Theta(n)$

→ For enqueue operation, → constant amount of time $\Theta(1)$ because it modifies only 2 pointers.

→ For Dequeue operation → we need address of second last node of single link list to make NULL, mtlb traversing krni hogi $\Theta(n)$

GATE-04

Q. Let P be a singly linked list. Let Q be the pointer to an inter... x in the list. What is the worst case time-complexity of the best known algorithm to delete the node x from the list?

A. O(n)
B. O(log² n)
C. O(log n)
D. O(1)

→ Traverse the LL until you find the node jisko delete karna hai।

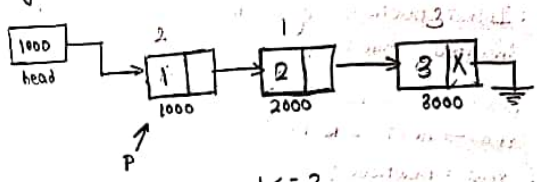
→ Lekin iske liye pointer should point to head node mtlb kuch gadbad hai।

→ Yaha pointer intermidiate node में है iss pointer को Brahmastra की तरह उपयोग करके O(1) में Delete कर सकते है।

GATE-03

Q. Consider the function f defined below:

```
struct item {
    int data;
    struct item *next;
};
int f(struct item *p) {
    return ((p == NULL) || (p->next == NULL) || ((p->data <= p->next->data) &&
                                                  f(p->next)));
}
```



For a given linked list p, the function f returns 1 if & only if

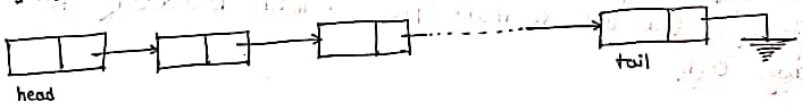
A. the list is empty or has exactly one element.
B. the elements in the list are sorted in non-decreasing order of data value.
C. the elements in the list are sorted in non-increasing order of data value.
D. not all elements in the list have the same data value.

The function f() works :

1) If linked list is empty return 1
2) Else if linked list has only one element return 1
3) Else if node→ data is smaller than equal to node→next→ data return 1
4) Else return 0

GATE-18

Q. A queue is implemented using a non-circular singly linked list. The queue has a head pointer and a tail pointer. Let n denote the number of nodes in the queue. Let 'enqueue' be implemented by inserting a new node at the head and 'dequeue' be implemented by deletion of a node from the tail.



GATE-17

Q. Consider the C code fragment given below:

```
typedef struct node {
  int data;
  node * next;
} node;

void join (node *m, node *n) {
  node *p = n;
  while (p -> next != NULL) {
    p = p -> next;
  }
  p -> next = m;
}
```

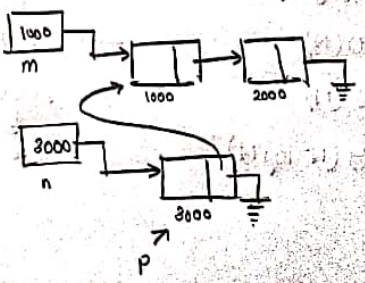
Assuming that m & n point to ~~m~~ & ~~n~~ valid NULL terminated linked lists, invocation of join will

A. append list m to the end of list n for all inputs.

B. either cause a null pointer dereference or append list m to the end of list n.

C. cause a null pointer dereference for all inputs.

D. append list n to the end of list m for all inputs



GATE-16

Q. N elements are stored in a sorted doubly linked list. For ~~a~~ operation, a pointer is provided to the records to be deleted. For a decrease-key operation, a pointer is provided to the record on which the operation is performed.

An algorithm performs the following operations on the list in this order: $\Theta(N)$ delete, $O(\log N)$ insert, ~~$O(\log N)$~~ find and $\Theta(N)$ decrease key. What is the time complexity of all these operations put together?

A. $O(\log^2 N)$

B. $O(N)$

C. $O(N^2)$

D. $\Theta(N^2 \log N)$

→ Pointer mila ~~है~~ Delete ~~करने~~ के ~~लिए~~

• Delete: $O(1)$

→ Insert: $O(N)$ → $O(N \log N)$, Find $O(N)$ → $O(N \log N)$ $O(1 \times N) = O(N)$

→ Decrease key: $O(N) \rightarrow O(N \times N) \rightarrow O(N^2)$

(Delete + insert)

Stack: LIFO/FILO

→ A stack is an Abstract data type commonly used in most programming languages.

→ It is name stack as it behaves like a real world stack.
For eg: a deck of cards or a pile of plates etc.

→ It allows operations at only one end.

→ A stack can be implemented by means of Array, structure, pointer & linked list और बाकी Questions में पता चलेगा!

→ Insertion operation is called Push & removal operation is known as POP.

→ It can be either fixed sized or dynamic ~~size~~ resizing.

★ Top pointer हमेशा top of the element को point करेगा!

Basic operations :

- Push() – pushing (storing) an element on the stack.
- Pop() – removing (accessing) an element from the stack.
- peek() – get the top data element of the stack without removing it.
- isFull() – Check if stack is full
- isEmpty() – Check if stack is empty.

(4)
```
int peek()
{ return stack[top];
}
```

(2)
```
bool isFull()
{ if (top==MAXSIZE)
    return true;
  else
    return false;
}
```

(3)
```
bool isEmpty()
{ if(top==-1)
    return true;
  else
    return false;
}
```

Push operation :

Push(Stack, Top, Maxstk, item)

Stack: Array
Top: Pointer ~~pointing~~ to top of stack index value
item: element to be inserted
Maxstk: max size of stack

(1) [To check overflow]
if(Top = Maxstk - 1) then
write "OverHow"

(2) Top = Top+1
Stack[Top] = item

(3) Exit

C-implementation :

```
void push (int data)
{ if (!isFull())
  {
    top = top+1;
    stack[top] = data;
  }
  else
  {
    printf(" नहीं Daal skte
            Stack full है");
  }
}
```

Pop Operation :

→ Accessing the content while removing it from stack is known as pop operation.

→ In an array implementation of pop() operation, the data element is not actually removed, instead top is decremented to a lower position in the stack to point to the next value.

→ But, in linked list implementation pop() actually removes data element and delocates memory space.

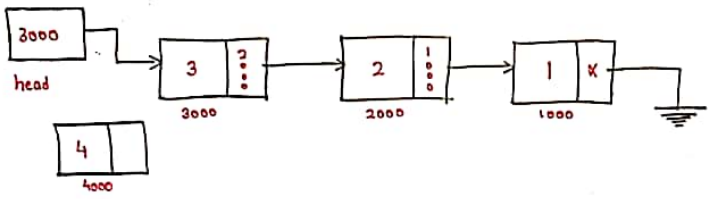
(1) [To check underflow]
if(Top==-1) then
write "Underflow"

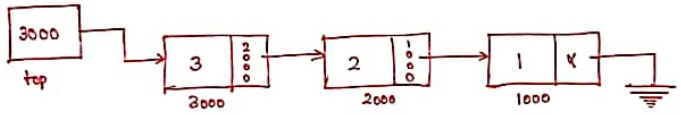
(2) Top = Top-1

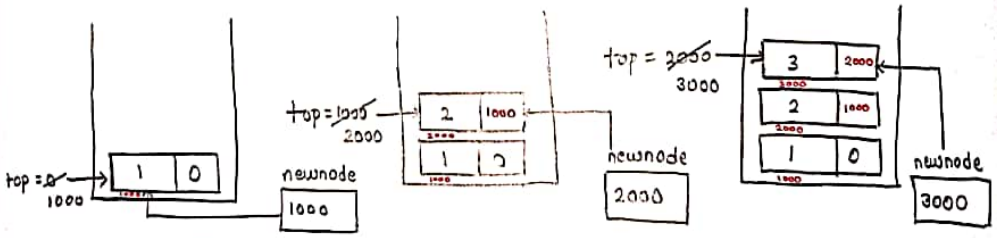
(3) Exit

```
int pop(int data)
{  if(!isEmpty())
   {
     data = stack[top];
     top = top-1;
     return data;
   }
   else { pf(" Nhi nikal skte khali
              ~~है~~ stack");
   }
}
```

Implementation of stack using linked list:

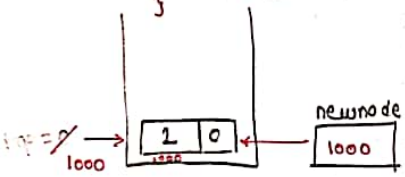






```
Struct node
{  int data;
   Struct node *link;
}
Struct node *top=0;
void push(int x)
{  Struct node *newnode;
   newnode = (Struct node*) malloc (sizeof(Struct node));
   newnode → data = X;
   newnode → next = top;
   top = newnode;
}
```

```
void main()
{  push(2);
   push(3);
   push(10);
   display();  10 3 2
   peek();  10
   pop();  10
   peek();  3
   display();  3 2
}
```

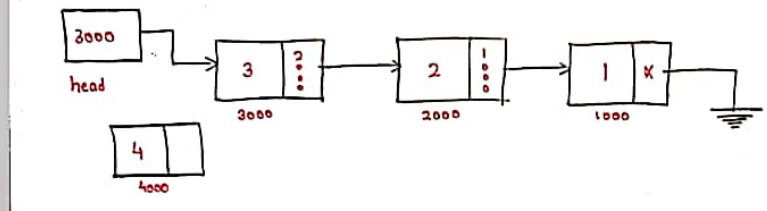


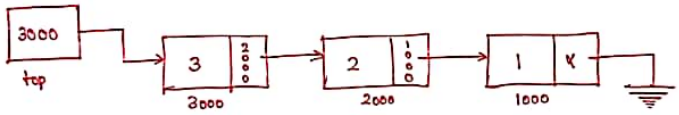
```
Void pop()
{  Struct node *temp;
   temp = top;
   if(top==0)
   {  pf("kuch nahi h");
   }
   else
   {  printf("%d", top→data);
      top = top→link;
      free(temp);
   }
}
```

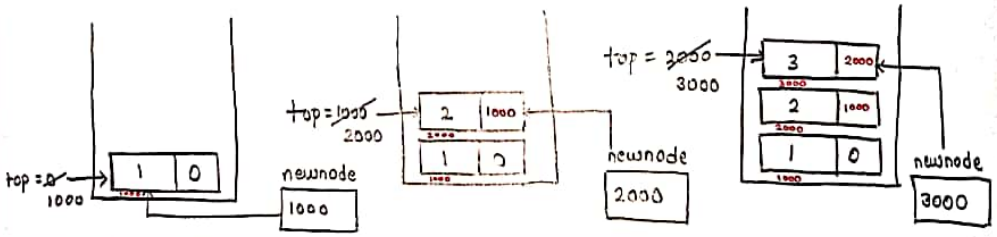
```
void display()
{ struct node *temp;
  temp = top;
  if (top==0)
  { pf("kuch nhi h");
  }
  else
  { while(temp!=0)
    { printf("%d", temp->data);
      temp = temp->link;
    }
  }
}
```

```
void peek()
{ if (top==0)
  { pf("kuch nhi h");
  }
  else
  { pf("top element is %d", top->data);
  }
}
```

Implementation of stack using linked list:

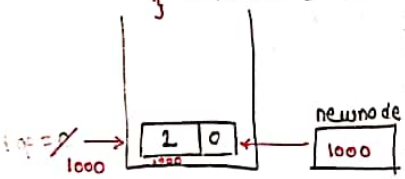






```
Struct node
{ int data;
  Struct node *link;
}
Struct node *top=0;
void push(int x)
{ Struct node *newnode;
  newnode = (Struct node*) malloc (sizeof(Struct node));
  newnode -> data = X;
  newnode -> next = top;
  top = newnode;
}
```

```
void main()
{ push(2);
  push(3);
  push(10);
  display();  10 3 2
  peek();  10
  pop();  10
  peek();  3
  display();  3 2
}
```



```
Void pop()
{ struct node *temp;
  temp = top;
  if (top==0)
  { pf("kuch नहीं है");
  }
  else
  { printf("%d", top->data);
    top = top->link;
    free(temp);
  }
}
```

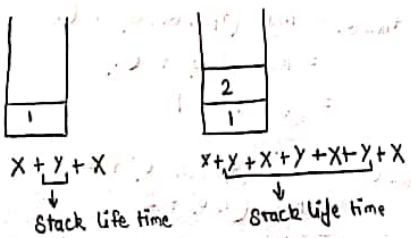
```
void display()
{ struct node *temp;
  temp = top;
  if (top==0)
  { pf("kuch nhi है");
  }
  else
  { while(temp!=0)
    { printf("%d", temp->data);
      temp = temp->link;
    }
}
```

```
void peek()
{ if (top==0)
  { pf("kuch नहीं है");
  }
  else
  { pf("top element is %d", top->data);
  }
}
```

IATE-03

Q. Let S be a stack of size $n \geq 1$. Starting with the empty stack, suppose we push the first n natural numbers in sequence and then perform n pop operations. Assume that Push & Pop operations take X seconds each and Y seconds elapsed between the end of one such stack operation and the start of the next operation. For $m \geq 1$, define the stack life of m as the time elapsed from the end of Push(m) to the start of the pop operation that removes m from S. The average stack-life of an element of this stack is

A. $n(X+Y)$ B. $3Y+2X$ C. $n(X+Y)-X$ D. $Y+2X$



GATE-05
Q. A function f defined on stacks of integers satisfies the following properties. $f(\phi) = 0$ & $f(push(s, i)) = \max(f(s), 0) + i$ for all stacks s & integers i.

If a stack S contains the integers 2, -3, 2, -1, 2 in order from bottom to top, what is f(S)?

$f(\phi) = 0 \longrightarrow$ stack is empty

i → element to be pushed

(1) $f_{new}(S) = \max(f_{prev}(S), 0) + 2$
$= \max(0, 0) + 2$
$= 2$

(2) $f_{new}(S) = \max(f_{prev}(S), 0) + (-3)$
$= \max(2, 0) + -3$
$= -1$

(3) $f_{new}(S) = \max(f_{prev}(S), 0) + (2)$
$= \max(-1, 0) + 2$
$= 2$

(4) $f_{new}(S) = \max(f_{prev}(S), 0) + (-1)$
$= \max(2, 0) + (-1)$
$= (2) - 1 = 1$

(5) $f_{new}(S) = \max(f_{prev}(S), 0) + (2)$
$= \max(1, 0) + 2$
$= (3)$

Q. Consider n elements that are equally distributed in k stacks. Each stack, elements of it are arranged in ascending order (min is at the top in each of the stack & then increasing downwards). Given a queue of size n in which we have to put all n elements in increasing order. What will be the time complexity of the best known algorithm?

A. $O(n \log k)$
B. $O(nk)$
C. $O(n^2)$
D. $O(k^2)$

→ $O(n \log k)$ by creating a min heap of size k & adding all the top-elements of all the stacks.

→ $O(k)$ → For creating heap of size k
→ $(n-k) \log k$ → Insertions into the heap

$O(n \log k)$

SRO-17
Q. The minimum no. of stacks needed to implement a queue is 2

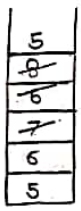
GATE-02
Q. To evaluate an expression without any embedded function calls:

A. one stack is enough
B. Two stack are needed
C. As many stacks as the height of the expression tree are needed.
D. A turning machine is needed in the general case.

Q. Suppose a stack is to be implemented with a linked list instead of an array. What would be the effect on the time complexity of the push & pop operations of the stack implemented using linked list?

A. $O(1)$ for insertion & $O(n)$ for deletion
B. $O(1)$ for insertion & $O(1)$ for deletion
C. $O(n)$ for insertion & $O(1)$ for deletion
D. $O(n)$ for insertion & $O(n)$ for deletion

Q. Consider an efficient implementation of a data structure STACK that support an operation "max()" that reports the current maximum among all elements in the stack. Normal stack operations ie, push, pop are also to be supported. The size of above data structure after performing operation push(5), push(6), push(7), pop, max, push(6), push(8), pop, pop, max, push(5) is ____ bytes. Assume that an integer can be stored in 4 bytes.

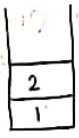


6 → 6 elements are left

6 × 4 = 24 bytes

GATE-03
Q. Let S be a stack of size $n \geq 1$. Starting with the empty stack, suppose we push the first n natural numbers in sequence and then perform n pop operations. Assume that Push & Pop operations take X seconds each and Y seconds elapsed between the end of one such stack operation and the start of the next operation. For $m \geq 1$, define the stack life of m as the time elapsed from the end of Push(m) to the start of the pop operation that removes m from S. The average stack-life of an element of this stack is

A. $n(X+Y)$ B. $3Y+2X$ C. $n(X+Y)-X$ D. $Y+2X$



$X + Y + X$ (Stack life time)

$X + Y + X + Y + X + Y + X$ (Stack life time)

GATE-05
Q. A function f defined on stacks of integers satisfies the following properties. $f(\phi) = 0$ & $f(\text{push}(S, i)) = \max(f(S), 0) + i$ for all stacks S & integers i.

If a stack S contains the integers 2, -3, 2, -1, 2 in order from bottom to top, what is f(S)?

$f(\phi) = 0 \rightarrow$ stack is empty

i → element to be pushed

(1) $f_{new}(S) = \max(f_{prev}(S), 0) + 2$
$= \max(0, 0) + 2$
$= 2$
